An analysis of photography of good interpretability reveals that the 70 BEV synchrotron at Serpukhov is nearing completion and could become operational this year. The annular hall (magnet tunnel) is now almost completely roofed and earth mounded. The 5 exhaust units at the inside edge of the annular hall, the experimental hall, the laboratory immediately south of the experimental hall, and all support facilities are now complete. The laboratory appears to have 6 roof vents. All outside construction work in the vicinity of the synchrotron appears to have been finished. A large unidentified building is under construction NE of the support area and will apparently be similar in size and configuration to a previously completed building in the support area.
